# 2013 REPORT CARD for **america's** INFRASTRUCTURE

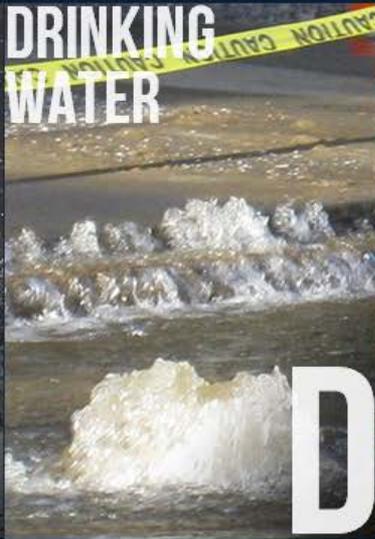

Every 4 years, the American Society of Civil Engineers releases a Report Card for America's Infrastructure that depicts the condition and performance of the nation's infrastructure in the familiar form of a school report card by assigning letter grades to each type of infrastructure.

## Colorado River Basin Water Supply and Demand Study

Executive Summary – Pre-Production Copy

If drastic reductions in GHGs are required, studies have found that it is more practical and less costly to reduce emissions in the electricity sector and electrify as much of other sectors as possible.

## Assessment of Climate Change in the Southwest U.S.

Assessment of Climate Change in the Southwest United States speaks broadly and clearly about climate and its effects on the people and landscapes of Arizona, California, Colorado, Nevada, New Mexico, Utah, the U.S.– Mexico border region, and the lands of Native Nations.

A landmark study in terms of its coverage and analysis (and a synthesis of knowledge from some 120 contributing experts), the book offers decision makers and stakeholders a substantial basis from which to make informed choices that will affect the well-being of the region's inhabitants in the decades to come.

# Average Global Temperature Projections

# Summary Points

## Climate Change and the West

Provides one more source of variability. “Old” variability continues.

Local and regional responses do not have to be the same as global scale.

Temp – Strongest consensus among the various climate elements

Temp – All show warming, amounts differ modestly among projections.

Precip – Sign, amounts, seasonality, frequency all matter.

Precip – Character of precipitation can be as important as amount.

Precip – More consensus for T than P, but some precip progress

Precipitation change – more winter, less spring, summer, autumn?

Precipitation change – Annual increase north / decrease south

More floods (winter) & droughts (summer) possible

Temperature is a hydrologic element – has significant implications

Temperature change is under way, began without our noticing.

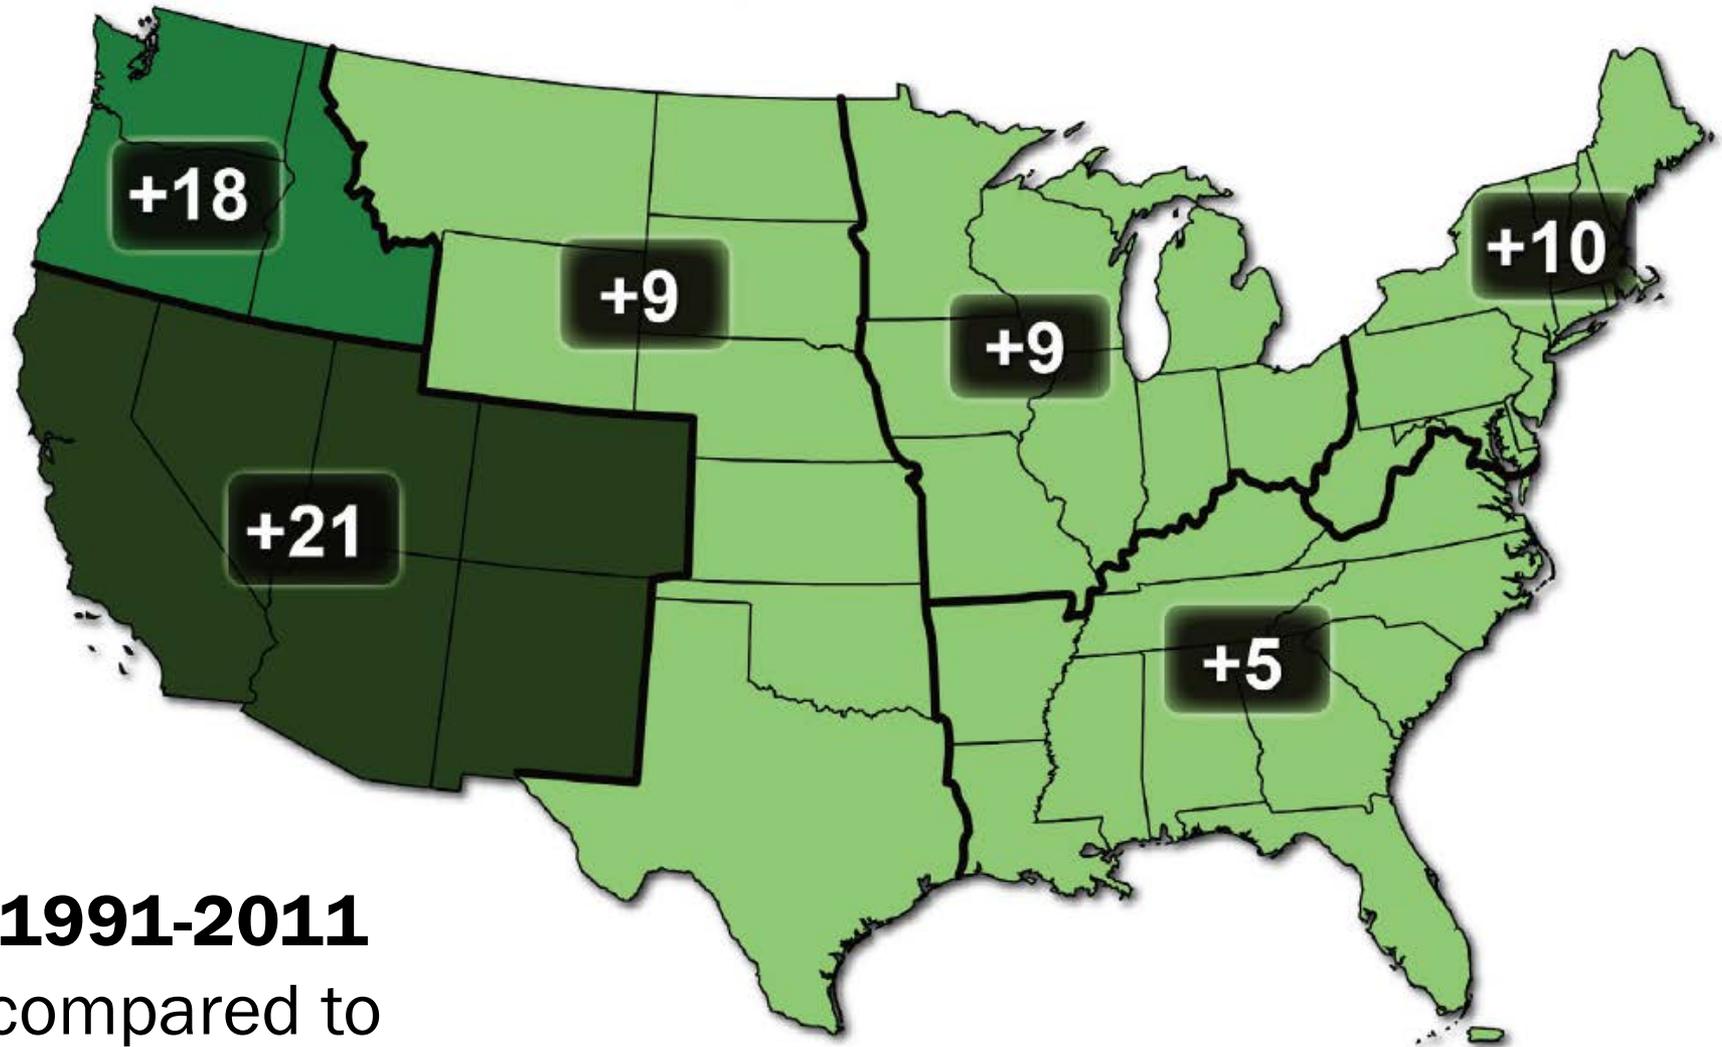

Western Mountains seem particularly vulnerable to climate change

System still has “unrealized warming;” earth radiation not in balance

Choice: Adaptation versus mitigation

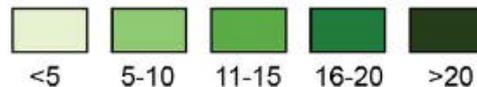

“Managing the unavoidable and avoiding the unmanageable”

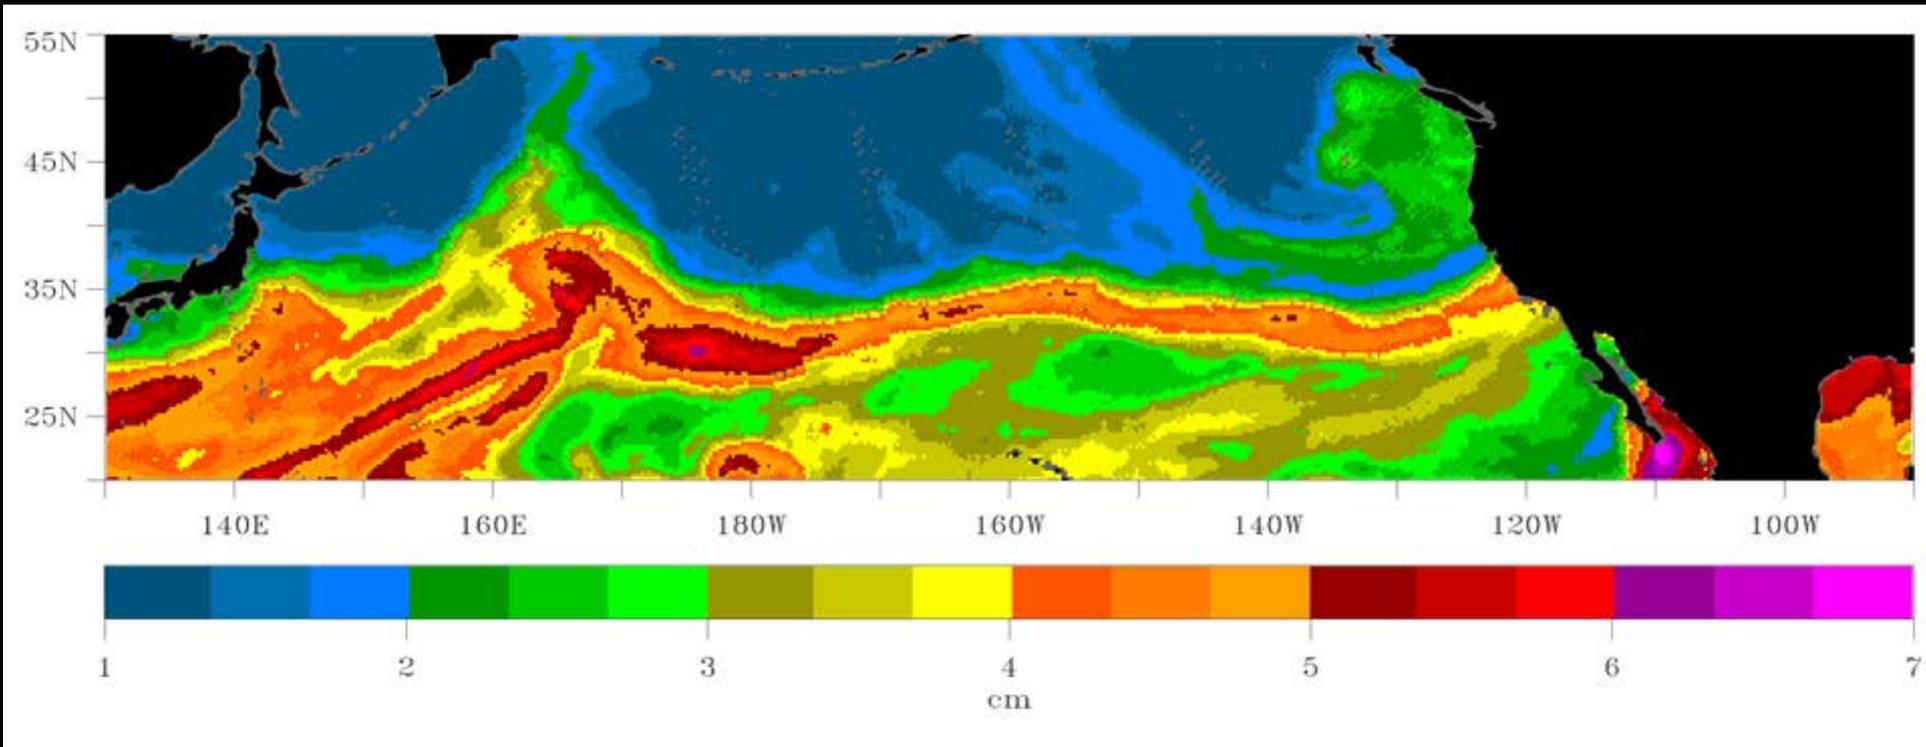

# Observed Changes in Frost-Free Season

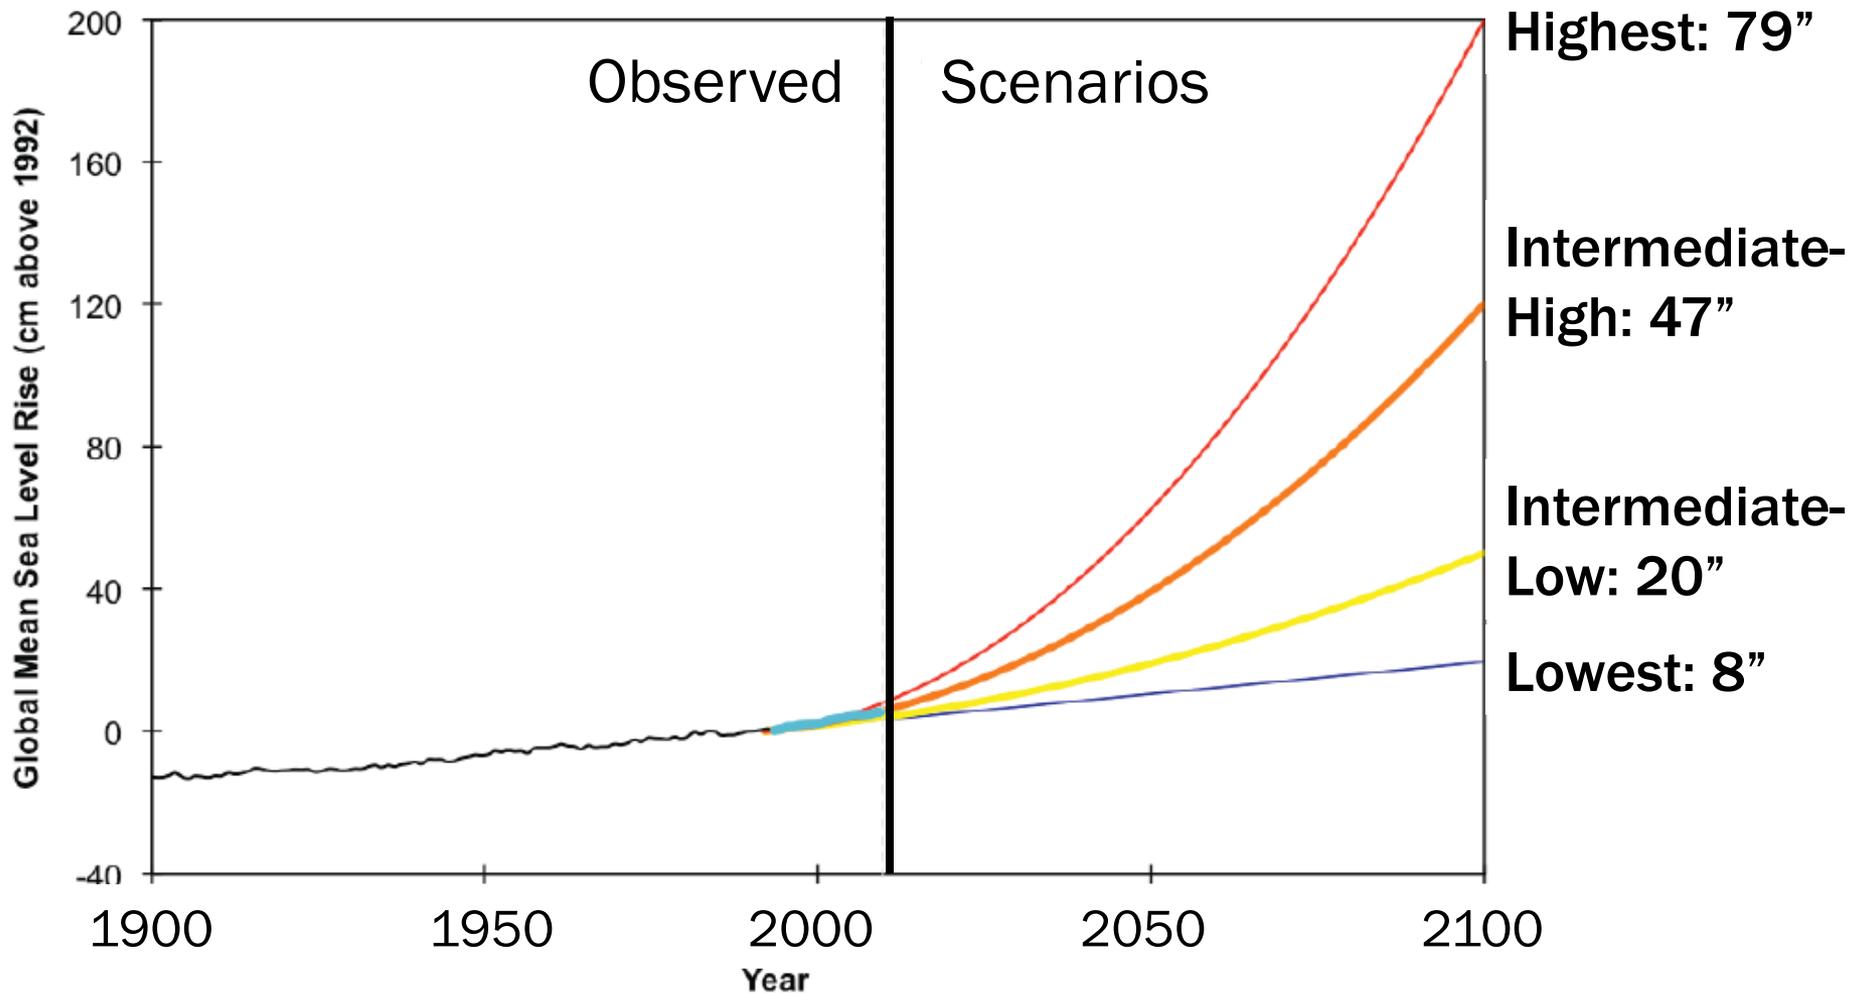

**1991-2011**  
compared to  
**1901-1960**

Increases in Annual Number of Days

# Atmospheric Rivers

Parris et al., 2012 Global Sea Level Rise Scenarios for the United States National Climate Assessment

# Adaptation

## Supports

## Undermines

Mitigation  
Supports  
Undermines

- **Forest fuel management**
  - reduces fire risk
  - maintains watershed health
  - decreases **C** releases

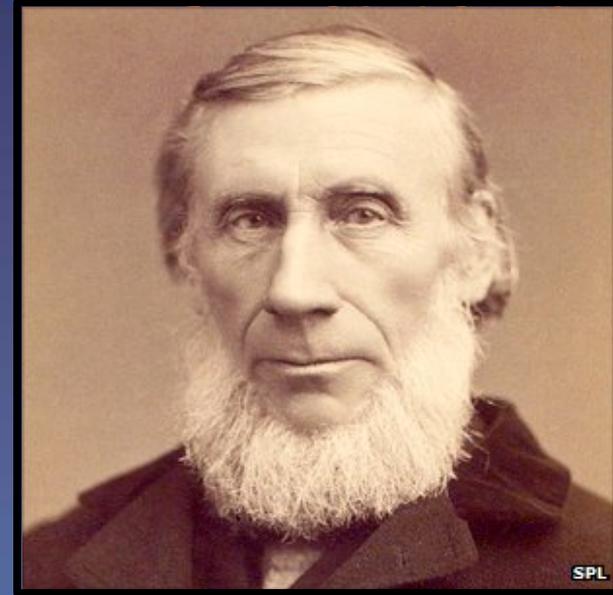

- **Compact *coastal* urban design**
  - reduces transportation emissions
  - greater UHI effect
  - floodplain development

- **Seawater desalinization**
  - increases water security
  - very energy-intensive

Business as usual...

# **The Science of Climate Change**

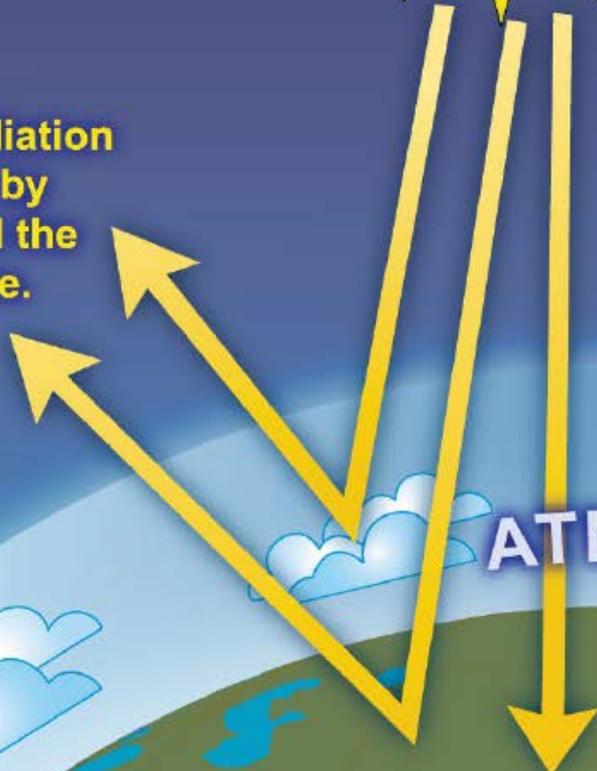

# The Greenhouse Effect

Solar radiation powers the climate system.

Some solar radiation is reflected by the Earth and the atmosphere.

About half the solar radiation is absorbed by the Earth's surface and warms it.

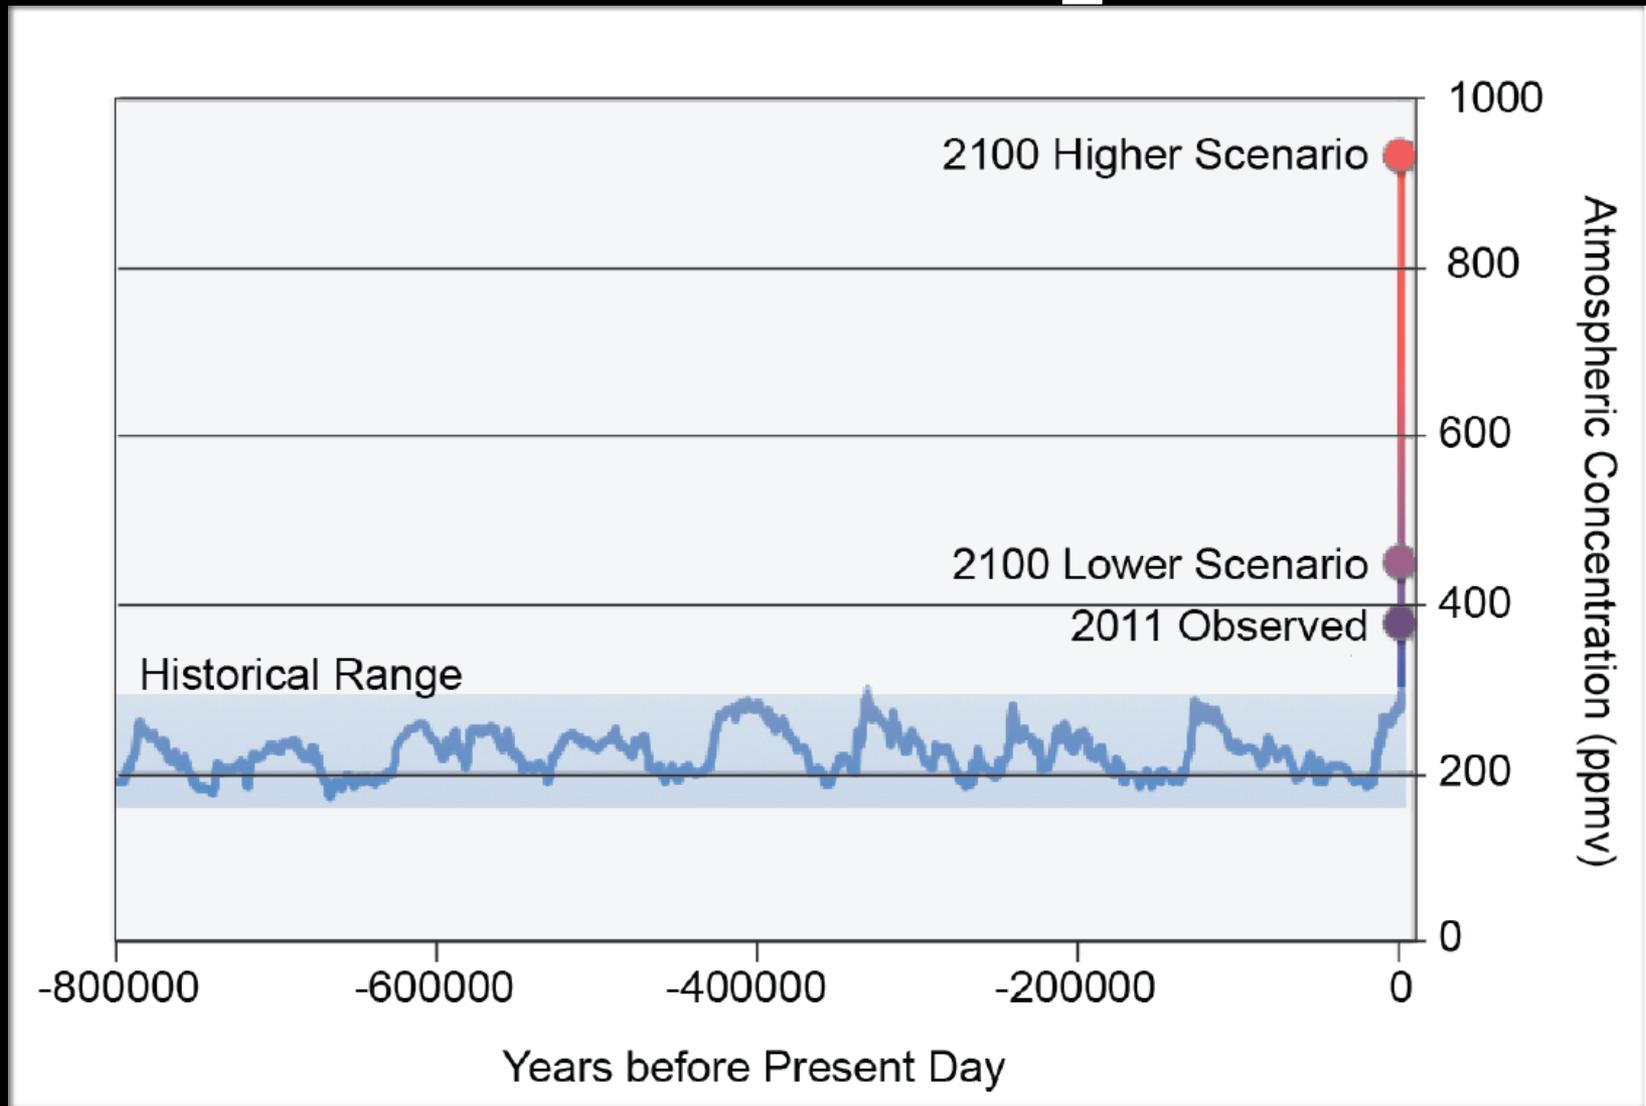

ATMOSPHERE

EARTH

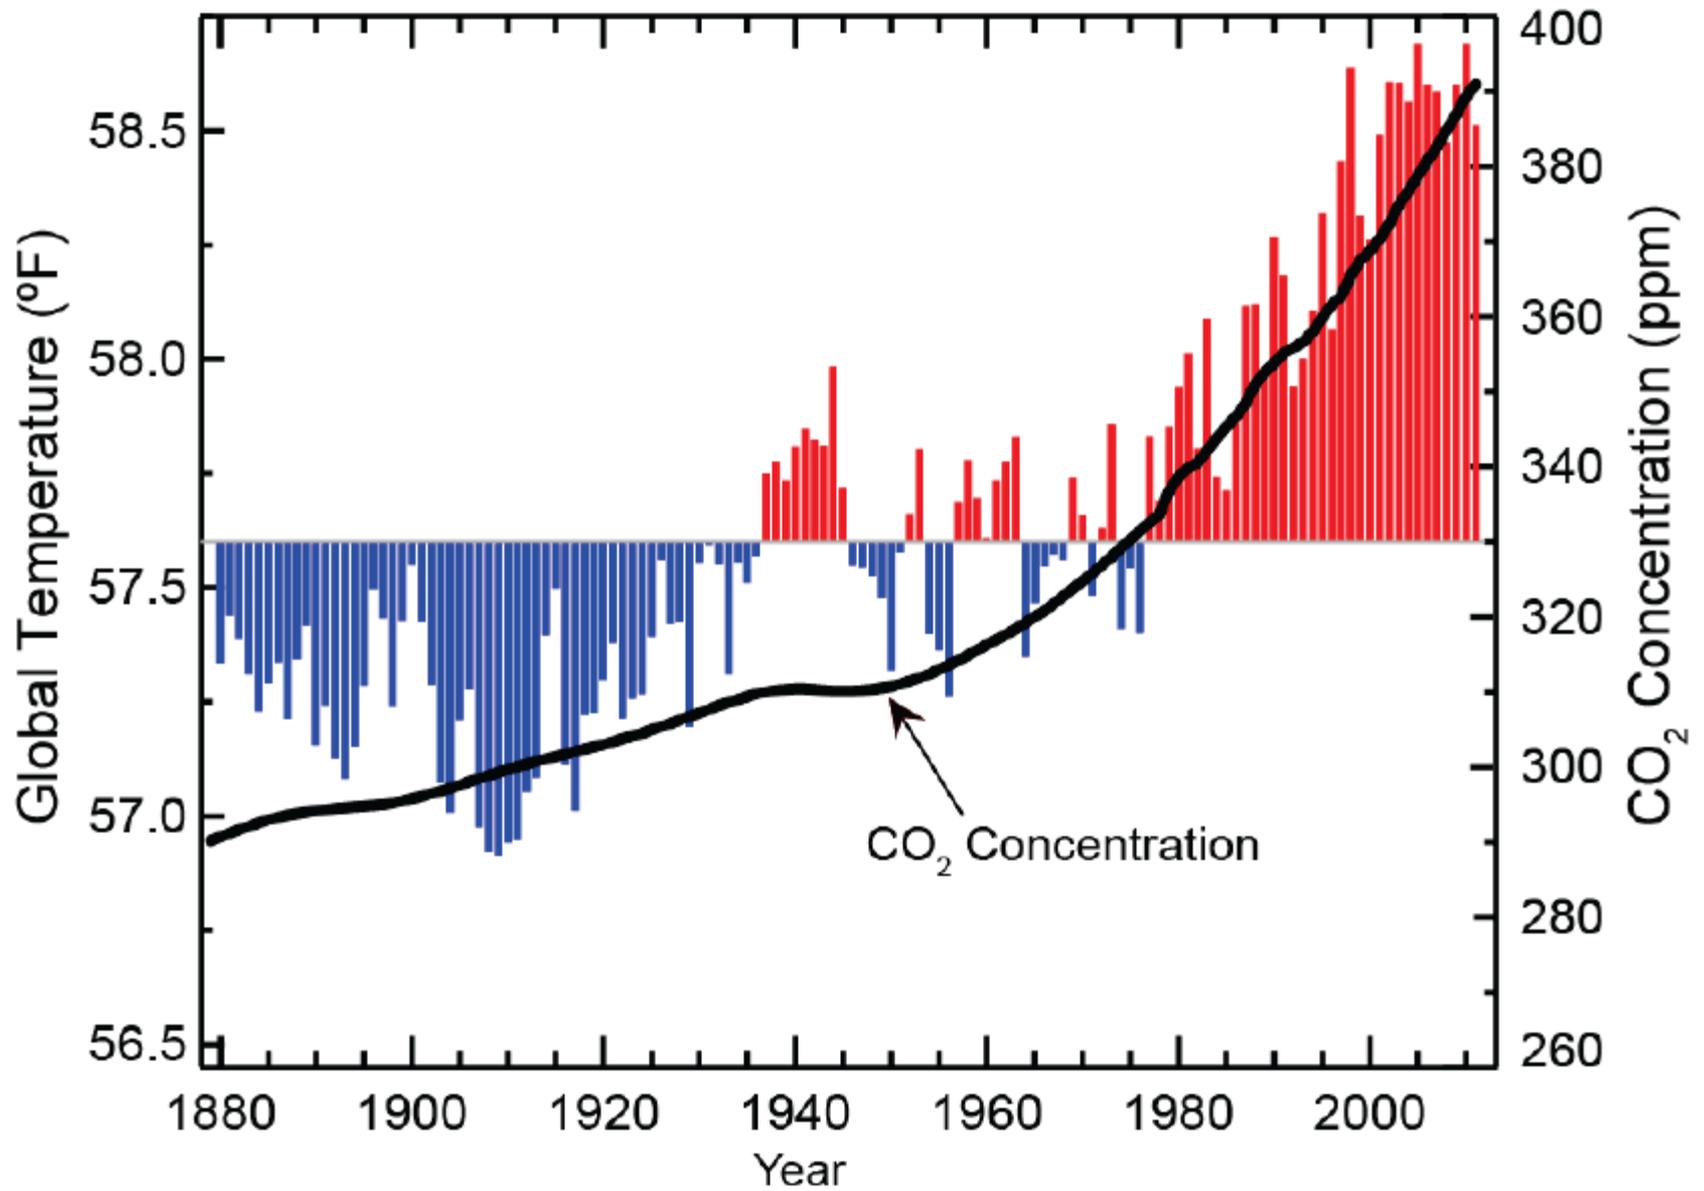

Infrared radiation is emitted from the Earth's surface.
